# Apply filters to SQL queries

#### Project description

In this hypothetical scenario, the organization I work for is working to make their system more secure. It is my job to ensure the system is safe, investigate all potential security issues, and update employee computers as needed. The following steps provide examples of how I used SQL with filters to perform security-related tasks.

# Retrieve after hours failed login attempts

There was a potential security incident that occurred after business hours (after 18:00). All after hours login attempts that failed need to be investigated.

The following code demonstrates how I created a SQL query to filter for failed login attempts that occurred after business hours.

```
MariaDB [organization]> clear
MariaDB [organization] > SELECT *
    -> FROM log_in_attempts
    -> WHERE login time > '18:00' AND success = false;
  event id
             username | login date | login time
                                                  | country | ip address
                                                                                  success
                         2022-05-10
                                                               192.168.205.12
                                                                                        0

  rows in set (0.003 sec)
```

This query filters for failed login attempts that occurred after 18:00. First, I started by selecting all data from the log\_in\_attempts table. Then, I used a WHERE clause with an AND operator to filter my results to output only login attempts that occurred after 18:00 and were unsuccessful. The first condition is login\_time > '18:00', which filters for the login attempts that occurred after 18:00. The second condition is success = FALSE, which filters for the failed login attempts.

# Retrieve login attempts on specific dates

A suspicious event occurred on 2022-05-09. Any login activity that happened on 2022-05-09 or on the day before needs to be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that occurred on specific dates.

<pre>MariaDB [organization]&gt; SELECT *     -&gt;     -&gt; FROM log_in_attempts     -&gt;     -&gt; WHERE login_date = '2022-05-08' OR login_date = '2022-05-09';</pre>						
event_id	username	login_date	login_time	country	ip_address	success

(Continues for another 60+ rows)

This query returns all login attempts that occurred on 2022-05-09 or 2022-05-08. First, I started by selecting all data from the log\_in\_attempts table. Then, I used a WHERE clause with an OR operator to filter my results to output only login attempts that occurred on either 2022-05-09 or 2022-05-08. The first condition is login\_date = '2022-05-09', which filters for logins on 2022-05-09. The second condition is login\_date = '2022-05-08', which filters for logins on 2022-05-08.

#### Retrieve login attempts outside of Mexico

After investigating the organization's data on login attempts, I believe there is an issue with the login attempts that occurred outside of Mexico. These login attempts should be investigated.

The following code shows how I created a SQL query to filter for login attempts that occurred outside of Mexico.

```
MariaDB [organization] > SELECT *
    -> FROM log in attempts
      WHERE not country LIKE 'mex%';
  event id | username | login date | login time | country | ip address
                                                                               success
                        2022-05-09 | 04:56:27
                                                              192.168.243.140

```

This query returns all login attempts that occurred in countries other than Mexico. First, I started by selecting all data from the log\_in\_attempts table. Then, I used a WHERE clause with NOT to filter for countries other than Mexico. I used LIKE with MEX% as the pattern to match because the dataset represents Mexico as MEX and MEXICO. The percentage sign (%) represents any number of unspecified characters when used with LIKE.

#### Retrieve employees in Marketing

My team wants to update the computers for certain employees in the Marketing department. To do this, I have to get information on which employee machines to update.

The following code shows how I created a SQL query to filter for employee machines from employees in the Marketing department in the East building.

```
MariaDB [organization] > select
    -> from employees
    -> where department = 'marketing' and office like 'east%';
  employee id | device id
                                                         office
                                username
                                           department

                                                         East-216
  rows in set (0.001 sec)
```

This query returns all employees in the Marketing department in the East building. First, I started by selecting all data from the employees table. Then, I used a WHERE clause with AND to filter for employees who work in the Marketing department and in the East building. I used LIKE with East% as the pattern to match because the data in the office column represents the East building with the specific office number. The first condition is the department = 'Marketing' portion, which filters for employees in the Marketing department. The second condition is the office LIKE 'East%' portion, which filters for employees in the East building.

# Retrieve employees in Finance or Sales

The machines for employees in the Finance and Sales departments also need to be updated. Since a different security update is needed, I have to get information on employees only from these two departments.

The following code shows how I created a SQL query to filter for employee machines from employees in the Finance or Sales departments.

```
MariaDB [organization]> select
     > from employees
    -> where department = 'finance' or department = 'sales';
  employee id | device id
                               username
                d394e816f943 | sgilmore |
                h174i497j413 | wjaffrey
                i858j583k571 |
                                                         South-170
                                abernard
                                lrodrigu
         1009
                NULL
                                           Sales
                                                         South-134
         1010
                k2421212m542 |
                               jlansky
                                           Finance
                                                         South-109
```

This query returns all employees in the Finance and Sales departments. First, I started by selecting all data from the employees table. Then, I used a WHERE clause with OR to filter for employees who are in the Finance and Sales departments. I used the OR operator instead of AND because I want all employees who are in either department. The first condition is department = 'Finance', which filters for employees from the Finance department. The second condition is department = 'Sales', which filters for employees from the Sales department.

# Retrieve all employees not in IT

My team needs to make one more security update on employees who are not in the Information Technology department. To make the update, I first have to get information on these employees.

The following code shows how I created a SQL query to filter for employee machines from employees not in the Information Technology department.

```
MariaDB [organization]> select *
    -> from employees
    -> where department != 'information technology';
                                                              office
  employee id | device id
                                username
         1000 | a320b137c219
                               elarson
                                         | Marketing
                                                             East-170
         1001

         1003
                d394e816f943
                               sgilmore
                                           Finance
                                                              South-153
```

The query returns all employees not in the Information Technology department. First, I started by selecting all data from the employees table. Then, I used a WHERE clause with != (i.e. NOT) to filter for employees not in this department.

# **Summary**

I ensured the system was safe, by investigating all potential security issues, I also updated employee computers as needed. These tasks were accomplished by applying filters to SQL queries to get specific information on login attempts and employee machines.
